

INTERNAL & OPERATIONAL GUIDE

Tools & technology we work with.

The systems that keep goods moving, numbers accurate and books current
— chosen for reliability, integration and security rather than fashion.

HOW WE CHOOSE TOOLS

Fewer systems. Better connected. Always accountable.

We do not collect software. Every tool must improve one of three things: the accuracy of a record, the visibility of an operation, or the speed of a decision. Where possible we prefer cloud platforms that talk to each other so that a shipment, a dashboard and a ledger entry describe the same event.

Cloud-first

Access from office, warehouse or client site. Automatic updates. No servers to babysit.

Integrated

Native connections or documented APIs. We avoid isolated spreadsheets as a source of truth.

Secure by default

Multi-factor authentication, role-based access, encryption in transit and at rest, audit logs.

Company-wide (every employee)

These are the tools every person at Ever Point Holding is expected to use fluently.

TOOL	PURPOSE
Microsoft 365 Business Premium (or equivalent)	Email (Outlook), calendar, Word, Excel, PowerPoint, OneDrive / SharePoint for documents, Power Automate for simple workflows. Single identity for most other systems.
Microsoft Teams	Daily internal chat, channels by division/client, video meetings, file collaboration and presence. Primary communication hub.
1Password Business (or Bitwarden Enterprise)	Shared vaults for client logins, banking portals and supplier systems. No passwords in chat or spreadsheets.
DocuSign or Adobe Acrobat Sign	Contracts, NDAs, service agreements and proof-of-delivery where a legal signature is required.
Microsoft Defender + Intune	Endpoint protection, device management, encryption and remote wipe for company laptops and mobiles.
MFA everywhere	Authenticator app (or hardware key for privileged accounts) on email, accounting, TMS, banking and analytics.

*Alternative stack: Google Workspace + Google Meet + Google Drive if the company standardises on Google rather than Microsoft.
The rest of this document assumes Microsoft 365 because of Power BI and Excel depth.*

DIVISION I

Logistics & supply chain tools

Staff in logistics work with movement, documents, inventory and exceptions. Tools must produce a timestamped, auditable record that bookkeeping and analytics can trust.

TOOL / CATEGORY	TYPICAL USE
TMS — Transportation Management System e.g. CargoWise, Magaya, Aljex / 3Gtms, or a mid-market equivalent	Quotes, bookings, multi-leg consignments, carrier rates, documents (AWB, BOL, commercial invoice), status events and invoicing.
WMS / Inventory e.g. Fishbowl, Cin7, Unleashed, or TMS warehouse module	Goods-in / goods-out, locations, cycle counts, pick/pack, stock valuation that agrees with the ledger.
Fleet & telematics e.g. Samsara, Geotab, Verizon Connect, Motive	GPS, driver hours, fuel, maintenance alerts, cameras (where used), proof-of-delivery photos and geofence events.
Route & last-mile e.g. OptimoRoute, Routific, Google Maps Platform	Daily run planning, ETAs, driver app, exception capture.
Customs & trade region-specific (Descartes, local broker software)	Declarations, duties, restricted-party screening, archive of filings.
Hardware	Zebra / Honeywell barcode scanners, mobile label printers, rugged tablets or phones for drivers/warehouse, A4 and thermal printers, scales where needed.

DIVISION II

Data analytics tools

Analysts turn operational and financial data into answers. The stack is deliberately small: a warehouse or well-structured database, Excel for modelling, Power BI for delivery, Python only when the question needs it.

TOOL	TYPICAL USE
Microsoft Excel 365	Power Query, Power Pivot, structured tables. Still the fastest way to explore a new dataset and to build models clients can open.
Microsoft Power BI	Published dashboards and paginated reports: delivery KPIs, stock turns, margin, cash, ageing. Scheduled refresh from accounting, TMS and databases.
SQL database Azure SQL, PostgreSQL, or equivalent	Clean, versioned source of truth. Not a dumping ground of raw CSVs.

Python (optional / senior)
VS Code or Jupyter, Pandas, etc.

Heavier cleaning, forecasting, custom extracts. Scripts stored in Git (GitHub / Azure Repos).

Light automation

Power Automate, or Make / Zapier for smaller jobs

Moving files, alerting on thresholds, posting a weekly pack. Not a substitute for proper pipelines.

DIVISION III

Bookkeeping & finance tools

Books are kept current, reconciled and reviewable at any time. Capture is as automated as volume allows; review is always human.

TOOL	TYPICAL USE
Cloud accounting Xero or QuickBooks Online (Advanced)	General ledger, bank feeds, sales and purchase invoices, VAT/GST or local tax, multi-currency, management reports. Choice depends on country and client mix — one platform as the company standard.
Receipt & invoice capture Dext, Hubdoc, or native OCR	Photos and PDFs coded and published into the ledger with supporting image attached.
Payroll Xero Payroll, QuickBooks Payroll, or local specialist (ADP, Sage, etc.)	Statutory deductions, payslips, journals posted automatically. Confirm local compliance before go-live.
Payables automation (when volume justifies) e.g. Bill.com, ApprovalMax, or native	Approval workflows, scheduled payments, audit trail from invoice to bank.
Banking & cards	Business accounts with reliable feeds. Corporate cards with receipt rules. Dual-control on payments above an agreed threshold.
Reporting overlay	Native management accounts plus Power BI for board packs, cash-flow and KPI commentary. Month-end close checklist (SharePoint or Teams).

Hardware issued to staff

Office / professional roles

Business laptop (MacBook / Latitude / EliteBook class), 16 GB RAM minimum, 512 GB SSD, FHD or better. Iphone and An Ipad, Dual 24–27" monitors for bookkeepers and analysts. Quality headset. Docking station.

Operations / warehouse / drivers

Rugged smartphone or tablet, barcode scanner, mobile printer where needed, high-visibility charging. Vehicles fitted with telematics as standard on company fleet.

All devices are company-managed (Intune), encrypted, and covered by a 3-year business warranty plus accidental-damage where justified. Personal devices are not used for client data.

What you need to be able to do

We train on our specific systems. We expect, on day one, comfort with the basics of professional work:

Everyone

Email and calendar discipline, Teams, file naming in SharePoint, MFA, not sharing passwords, treating client data as confidential.

By role

Logistics: documents, status updates, exception notes.

Analytics: Excel to a high standard; SQL or Power BI a strong advantage.

Bookkeeping: double-entry, reconciliations, a modern cloud package (Xero or QBO).
